

## Computation of Viscoelastic Beam properties of a woven composite TRAC Boom using Abaqus SwiftComp GUI, Texgen4SC and Swift Comp 2.1

### Viscoelastic Beam Properties of a TRAC Boom

In this example, we want to compute the Viscoelastic effective properties of a TRAC Boom fabricated from plain weave composite material made of isotropic viscoelastic matrix and transversely isotropic elastic fiber. The MSG solid model is used to predict the effective viscoelastic properties of a plain weave composite using a three part approach.

The first part predicts the effective viscoelastic yarn properties based on the elastic fiber and viscoelastic matrix properties at the microscale. The second part takes the effective yarn properties and matrix properties to predict the viscoelastic properties of weave composites. The third part takes the effective weave properties to predict the viscoelastic properties of the Trac Boom.

Yarn

Weave

Trac boom

Web height: 10 mm, Subtended angle: 90 degree, Radius of the flange (curved part): 25 mm, flange thickness is 1 mm.

The Layup is (0/45/-45/90/0)s , Ply thickness: 0.1 mm. The layup sequence is along with the direction pointing to the center of flange (Blue arrow).

The fiber properties are defined as transversely isotropic elastic by means of engineering constants and the matrix properties are given by means of the Prony coefficients with a constant Poisson’s ratio equal to 0.33 as specified in the table below.

Fiber properties defined as transversely isotropic elastic

E1 (MPa)	E2 (MPa)	G12 (MPa)	G23 (MPa)	v12	v23
233,000.0	15,000.0	8,963.0	5639	0.23	0.33

Prony coefficients and relaxation times for the matrix

s	∞	1	2	3	4	5	6	7
λ	-	10 <sup>3</sup>	10 <sup>5</sup>	10 <sup>6</sup>	10 <sup>7</sup>	10 <sup>8</sup>	10 <sup>9</sup>	10 <sup>10</sup>
E (MPa)	1,000.0	224.1	450.8	406.1	392.7	810.4	203.7	1486.0

Material

Properties

We will use a square pack 2D SG with fiber volume fraction equal to  $v_f = 0.64$ .

## Software Used

We will use TexGen4SC 2.0, SwiftComp 2.1 and Abaqus CAE with the Abaqus SwiftComp GUI for this tutorial. TexGen4SC 2.0 will be used to run the viscoelastic homogenization of the fiber-matrix square pack microstructure and also for the viscoelastic homogenization of the plain weave laminate. Abaqus CAE will be used to model the TRAC boom and to run the viscoelastic homogenization while SwiftComp runs in the background.

## Solution Procedure

The problem is solved in the following three steps:

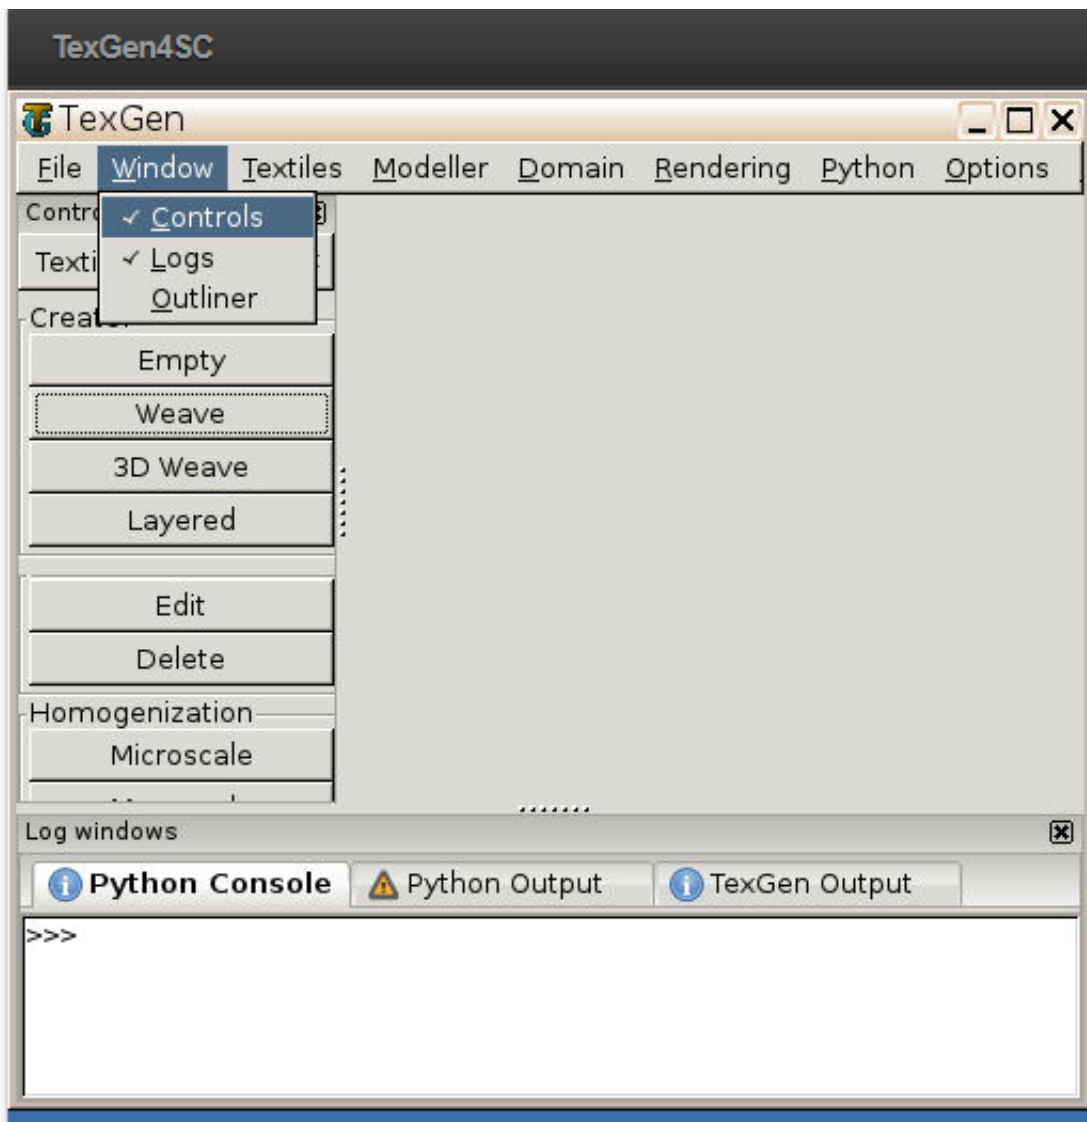

- Part 1- Micro-scale analysis of the square-pack fiber matrix micro structure using Texgen4SC.
- Part 2- Meso-scale analysis of the plain weave laminate using Texgen4SC.
- Part 3- Macro-scale analysis of the Trac Boom using Abaqus CAE with the Abaqus SwiftComp GUI and SwiftComp 2.1.

## Part 1- Micro-scale analysis of the square-pack fiber matrix micro structure using TexGen4SC.

TexGen4SC 2.0 provides a function to let users import the material properties from a text file. Refer to the [Predict viscoelastic plate properties of a single-layer plain weave laminate](#) tutorials for more details regarding preparation of the materials text file.

Follow the step-by-step procedure to solve the problem.

**# Step 1.1.** Create the plain weave pattern using TexGen4SC 2.0. Launch TexGen4SC 2.0 on cdmHUB, then Go to window-> controls-> "Weave" to create mesoscale plain weave SG.

Weave Wizard

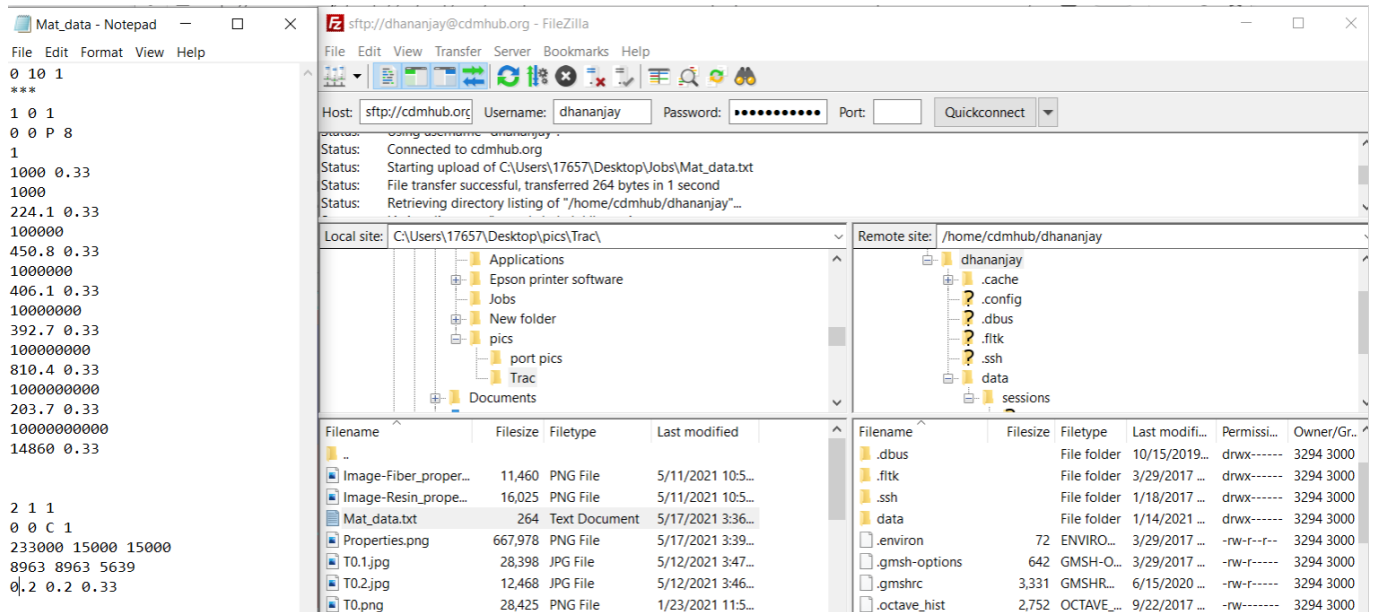

**# Step 1.2.** Keeping the geometric properties as required, Click on the upper-right and lower-left squares to get the woven pattern.

## Weave Pattern

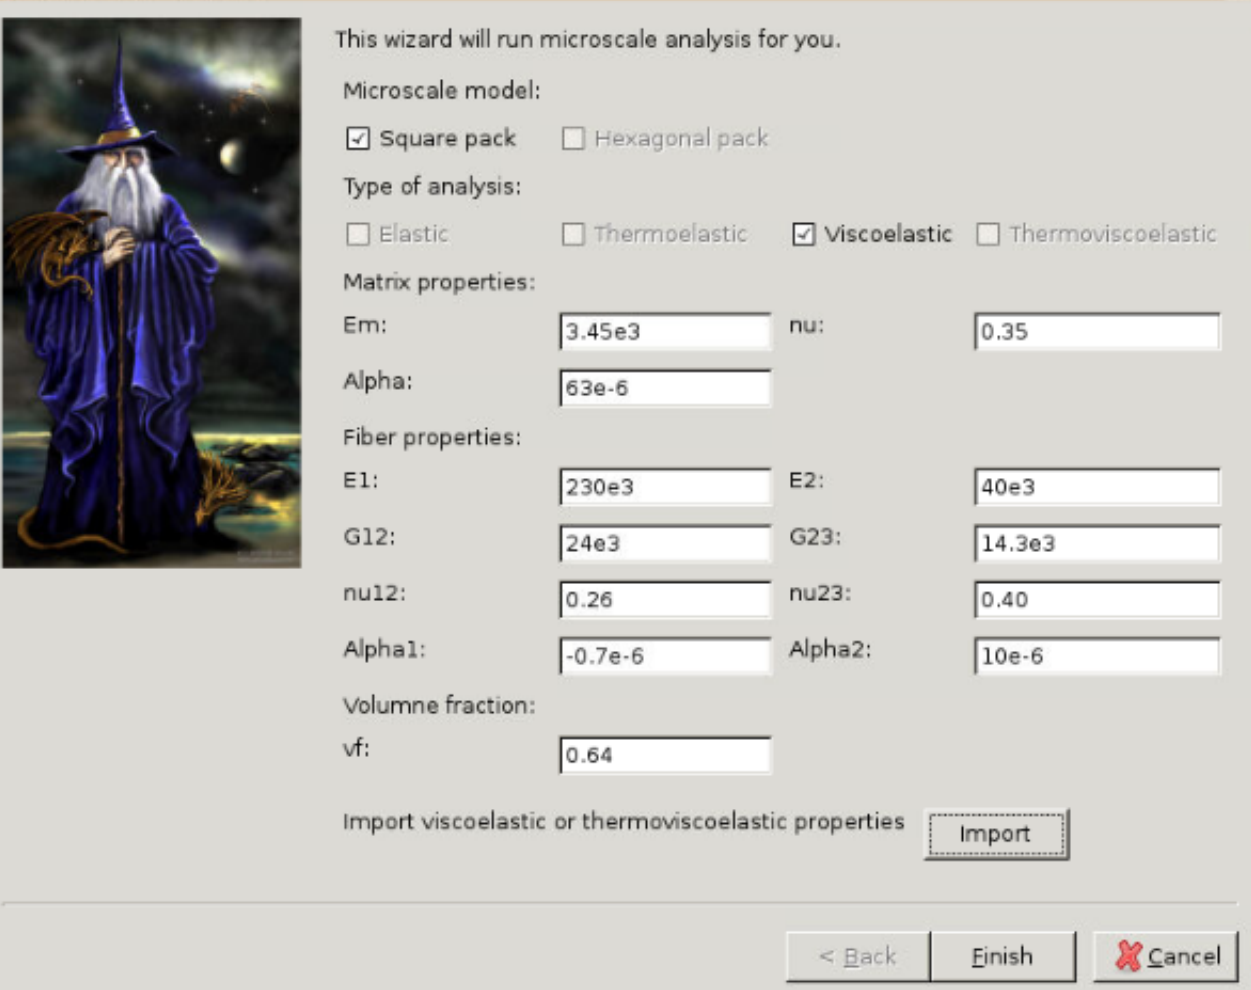

**# Step 1.3.** Upload the .txt file containing matrix and fiber properties to the current session, using any FTP app, for example, FileZilla, to set up connection with the current session. Refer to the [Predict viscoelastic plate properties of a single-layer plain weave laminate](#) Tutorials for more details.

# COMPUTATION OF VISCOELASTIC BEAM PROPERTIES OF A WOVEN COMPOSITE TRAC BOOM USING A

## Importing Material properties text file

**# Step 1.4.** Once you uploaded the .txt file, click “Microscale” under “Homogenization” tab for yarn property calculation. Select “Viscoelastic” as the type of analysis. Set fiber volume fraction to 0.64.

This wizard will run microscale analysis for you.

Microscale model:

Square pack     Hexagonal pack

Type of analysis:

Elastic     Thermoelastic     Viscoelastic     Thermoviscoelastic

Matrix properties:

Em:     nu:

Alpha:

Fiber properties:

E1:     E2:

G12:     G23:

nu12:     nu23:

Alpha1:     Alpha2:

Volume fraction:

vf:

Import viscoelastic or thermoviscoelastic properties

< Back    Finish   

## Homogenization

**# Step 1.5.** Ignore the matrix and fiber properties in the window, since the material properties will be imported from the uploaded file.

## Property file

**# Step 1.5.** Click “Import” and select the uploaded .txt file and Click “Finish”. Now a .sc file (micro.sc) will be generated that SwiftComp will take as the input. SwiftComp will run on the cloud to calculate viscoelastic properties of yarns, e.g., effective microscale properties. In the pop-up window, you will find the analysis results.

## Meso Scale Results

# Step 2.4. Transfer this file to your local computer for further analysis.

## Part 3- Macro-scale analysis of the Trac Boom using Abaqus CAE with the Abaqus SwiftComp GUI and SwiftComp 2.1.

# Step 3.1. Using Abaqus CAE with the Abaqus SwiftComp GUI plugin, Create the part geometry for the TRAC Boom. Use Set sketch plane for customized SG -> Create planar shell -> Select the plane and vertical axis -> Sketch half of the base line (Highlighted as a red line). Its geometry is a straight line (Web height) from (0,10) to (0,0) and a curved line (Flange) from (0,0) to (25,-25) centered at (25,0). Using points at (1,10), (1,0), (25,-24) set the flange thickness to 1 mm to the right of the baseline and create the part. Mirror the part about the vertical to get the geometry of the TRAC Boom. Partition the part to separate the web and flange and also the individual flanges.

## Part Geometry

**# Step 3.2.** To enter the material properties for the part, first we need to choose the material properties from the results of the computed effective viscoelastic properties in the meso scale analysis. Within the Materials section of Abaqus CAE, we create a dummy material called “Material”. Please note that we will not define the material properties using the Abaqus SwiftComp GUI. Refer to the [Computation of effective viscoelastic properties with Abaqus SwiftComp GUI](#) tutorial for more details.

**Edit Material** [Close]

Name:

Description:

**Material Behaviors**

General Mechanical Thermal Electrical/Magnetic Other

dd

**# Step 3.3.** Use the material properties from the previous section . We need to convert the Constitutive relations provided as SwiftComp's results into Abaqus's Constitutive relations. This can be done by switching the 4th and 6th rows for the relation and also switching the 4th and 6th column of the stiffness matrix. The relations are provided below. Since the material properties are given as a time-dependent properties, We will create a text file to input the time-dependent material properties described row wise as –

D1111 (t) — D1122 (t) — D2222 (t) — D1133 (t) — D2233 (t) — D3333 (t) — D1112 (t) — D2212 (t) — D3312 (t) — D1212 (t) — D1113 (t) — D2213 (t) — D3313 (t) — D1213 (t) — D1313 (t) — D1123 (t) — D2223 (t) — D3323 (t) — D1223 (t) — D1323 (t) — D2323 (t) — Time, t for all 8 time intervals.

$$\begin{Bmatrix} \sigma_{11} \\ \sigma_{22} \\ \sigma_{33} \\ \sigma_{12} \\ \sigma_{13} \\ \sigma_{23} \end{Bmatrix} = \begin{bmatrix} D_{1111} & D_{1122} & D_{1133} & D_{1112} & D_{1113} & D_{1123} \\ & D_{2222} & D_{2233} & D_{2212} & D_{2213} & D_{2223} \\ & & D_{3333} & D_{3312} & D_{3313} & D_{3323} \\ & & & D_{1212} & D_{1213} & D_{1223} \\ & sym & & & D_{1313} & D_{1323} \\ & & & & & D_{2323} \end{bmatrix} \begin{Bmatrix} \epsilon_{11} \\ \epsilon_{22} \\ \epsilon_{33} \\ \gamma_{12} \\ \gamma_{13} \\ \gamma_{23} \end{Bmatrix}$$
